Management of urolithiasis is progressively becoming a complex sub-specialty in the urology field. The goal for the modern endourologist is looking at stone free operation, absence of complications and maximum comfort for the patient. This requires the perfect knowledge of all instruments available associated with the ability of adapting personal technique with patient and stone's characteristics. Furthermore, it is mandatory to have an adequate knowledge of all conditions causing stone formation, how to diagnose and prevent them.

The project Donatello wants to offer to trainees a comprehensive/intense course in the field of stone treatment which, we believe, is becoming fundamental for all urologists with interest in this sub-specialty.

This course is addressed to trainees at third year of Specialty training, it is three days long alternating lectures, hands-on on dry lab, live and semi-live sessions.

At the end of the course, a proficiency questionnaire will be performed. The trainee with the best result will be offered a subsequent training opportunity.
